Opportunity To Make Able To Safe Guard Everyone From All Walks Of life , Regardless Of The Education Financial Background & Experience From Every Where Across The Country, Who Want The Best In Their Lives Just Like All Of Us To Fulfill Their Dreams Of Prosperity.Build & Expand With Dedicated Work Efforts.

Our
Vision

What Is Vermicompost

Vermicast (worm castings) is the material deposited by the earthworms after the material passes through the digestive tract of the worm (worm manure). Vermicompost is the product of the decomposition process using various species of worms, usually red wigglers, white worms, and other earthworms, to create a mixture of decomposing vegetable or food waste, bedding materials, and vermicast. When you add vermicast to your soil, you help the soil absorb and retain moisture.

The organic matter in vermicast helps the soil particles clump together, improving soil structure. Vermicast contains myriad nutrients that are plant-available and released gradually into the soil.

VERMI - COMPOST

Benefits Of Vermicompost

By their activity in the soil, earthworms offer many benefits: increased nutrient availability, better drainage, and a more stable soil structure, all of which help improve farm productivity. Worms feed on plant debris (dead roots, leaves, grasses, manure) and soil. Mostly this species is being used for making manure. This is also known as Red Worm. This is red, brown or violet in color and colored strips are seen on its posterior part.

Vermicompost is one of the best fertilizers & soil conditioner that can be used for potted plants. It can be mixed with soil, cocopeat or even sand. Various combinations of ideal potting mixtures can be made by using vermicompost, depending on the type of plant.

Characteristics of Vermicompost

Earthworms are insects with smooth skin, whose body is made up of many small segments. If you look at the body you can see lines that mark the segments. Each segment has stiff short hairs that help the worm move, sometimes the hairs are difficult to see. They have no skeleton, but a lot of muscles. Evaporation of water from the land will reduce.

Therefore, irrigation water will be saved. Earthworms bring up the soil below and make it of better quality. Due to abundance of humus in earthworm manure, nitrogen, phosphorus, potash and other trace elements are available to the plants in sufficient quantity and quickly.
